# **Executive Summary**

Tactran's new Regional Transport Strategy sets out key outcomes for change in the region's transport system, and targets to define the scale of ambition. This report provides an evidence base for these targets, and a commentary on their implementability.

Each target, and a summary of the analysis and its conclusions, is provided in the tables below.

Proposed Regional Target	Reduce emissions from transport in line with the national target of a reduction of 56% by 2030 (compared to 1990)	
	Promote Ultra Low Emission Vehicle (ULEV) adoption to achieve 72.7% of the 56% reduction in CO2 by 2030	
Is the target achievable?	No	
Summary of rationale	Achievement of the target relies on both reduced demand for transport and changes to the road vehicle fleet to reduce reductions per km that are greater than are anticipated under a current 'best case' scenario in the Tactran region.  That emissions will not meet the target has been implicitly recognised by the Scottish Government's recent withdrawal from their national targets for 2030.	
What could be achieved by 2030?  If the Scottish Government/Transport Scotland's updated route map achievement of the 20% car-km reduction target by 2030, due to be later in 2024, leads to the delivery of effective measures then a sign reduction in emissions from car use is to be expected.  Some further reductions are anticipated from replacement of vehicle more efficient vehicles, and through rail decarbonisation.		

Proposed Regional Target	Reduce car kilometres driven in line with the national target of reducing car km driven by 20% by 2030 (compared to 2019 levels)
Is the target achievable?	Only if the Scottish Government/Transport Scotland's forthcoming updated road map for car-km reduction sets out deliverable measures to achieve the target nationally.
Summary of rationale	There is no foreseeable scenario in which the target can be achieved using only regional/locally-led measures; action by national government is required.
What could be achieved by 2030?	At best, actions by Tactran and regional partners would lead to traffic levels in 2030 being around 92% of those in 2019. But this relies on assumptions of funding and political support for change that are currently not foreseen.  A business-as-usual forecast is for car-km in the region in 2030 to be 115% of those in 2019.

Proposed Regional Target	Meet the targets set out in Scotland's Road Safety Framework to 2030	
	Progress and actions in relation to this target are established by Scotland's Road Safety Framework to 2030 and by local authorities in the region, and so this target has not been considered as part of this review	

Proposed Regional Target	For the least affluent SIMD data zones achieve the Transport Scotland's forecasts for average proportion of journeys walked and cycled by 2030 Large urban areas: 30% walk / 24% cycle Other urban areas: 24% walk /19% cycle Accessible small towns: 26% walk 13% cycle
Is the target achievable?	No
Summary of rationale	The targets are developed from analysis presented in the second Strategic Transport Projects Review and should be considered to be challenging long-term targets, based on the delivery of significant improvements to active travel infrastructure within and between all communities in the region. It is not currently foreseen that sufficient budget will be available to deliver the improvements by 2030 and, even if it was, timescales for delivery of on-going projects suggest that relatively little additional investment can be completed within that period.
What could be achieved by 2030?	An ambitious but possibly achievable target would be to increase the mode share of walking in the most deprived communities by approximately one percentage point by 2030 (with the number of walking journeys increasing by 3-6%), and the mode share of cycling in the range of 2 to 4 percentage points (with the number of cycling journeys increasing between one- and three-fold).
Proposed Regional Target	National Emission Ceiling Directive thresholds are reflected in Crieff, Dundee City and Perth City Air Quality Management Plans and Dundee Low Emission Zone. Including:  NO2 annual mean (not to exceed 40µg m-3)  number of NO2 exceedances (200µg m-3 not to be exceeded more than 18 times a year)
	Action by the region's local authorities is understood to be on track for air quality standards to be met, and so this target has not been considered as part of this review.
Proposed Regional Target	% of employed adults who could use public transport for work in least affluent areas to be equal to or better than the average for the Council area
	As there is presently no accurate baseline data on ability to access work by public transport, the achievability of this target is not assessed as part of this review.

Proposed Regional Target	Improve public transport journey time and journey time reliability on key bus corridors in accord with the Bus Partnership Fund bids
	Ensure journey time reliability to key freight origins/destinations remains with 95% of average journey time
Is the target achievable?	Unlikely to be fully achievable, but significant progress could be made with Scottish Government/Transport Scotland support.
Summary of rationale	The first part of the target appears to be achievable subject if Bus Partnership Funding is unpaused by Transport Scotland, if Dundee City and Perth & Kinross Councils are successful with their applications, and that funding becomes available in time to enable delivery by 2030. There are, however, uncertainties around all three of these assumptions.  Making progress towards the second part of the target would rely on measures which would reduce traffic flow across the road network. This would occur if the Scottish Government's 20% car-km reduction target by 2030 was to be achieved, but forecasts suggest that it is likely that some congestion hotspots would remain even in this case, so it would be unlikely that the target would be achieved in every location in the region.
What could be achieved by 2030?	Without Scottish Government/Transport Scotland intervention to fund bus priority and reduce traffic volumes, it is anticipated that traffic levels will rise in the region by 2030 and that journey time reliability for public transport and freight will worsen.

# 1. Introduction

Tactran's new Regional Transport Strategy (RTS)<sup>i</sup> sets out key outcomes for change in the region's transport system, and targets to define the scale of ambition.

Those targets, as set out in the consultation RTS are:

Key RTS Outcomes	Proposed Regional Target	Scale of the challenge	What needs to be done
Reduce estimated CO <sub>2</sub> emissions from transport in the region	Reduce emissions from transport in line with the national target of a reduction of 56% by 2030 (compared to 1990)	Angus, Perth & Kinross and Stirling all have higher transport CO <sub>2</sub> emissions per head than the Scottish average  If current trends are maintained, it is likely that a reduction of only 11% may be likely.	Decarbonisation of vehicle transmissions Reduce mileage driven
Increase the share of EV and low emission vehicle use	Promote Ultra Low Emission Vehicle (ULEV) adoption to achieve 72.7% <sup>ii</sup> of the 56% reduction in CO <sub>2</sub> by 2030	Approximately 2.2 % of vehicles registered in the region were hybrid, electric or ULEV in 2021	Rapid introduction and adoption of low and zero-emission technologies
Reduce car kilometres driven	Reduce car kilometres driven in line with the national target of reducing car km driven by 20% by 2030 (compared to 2019 levels)	National target means reversing 29+ yrs of growth in car km in 6 years  82% car mileage is generated to or from our rural areas and towns  Over ¾ of personal mileage is generated by trips over 10km	Improve alternatives for longer trips Facilitate shorter trips through more services being delivered locally Discourage car trips where there are reasonable alternatives and facilitate shorter trips Improve access to public transport
Reduce fatalities and injuries	Meet the targets set out in Scotland's Road Safety Framework to 2030 <sup>iii</sup>	Any number of fatalities or casualties are too many. While good progress has been, and continues to be, made across most of the region in the last 10years, close attention needs to continue to be paid to longer term trends	Reduce traffic speeds and consider engineering solutions to address identified safety concerns  Provide road safety education and campaigns

Key RTS Outcomes	Proposed Regional Target	Scale of the challenge	What needs to be done
Increase the levels of walking and cycling in the least affluent SIMD data zones	For the least affluent SIMD data zones achieve the Transport Scotland'siv forecasts for average proportion of journeys walked and cycled by 2030v  Large urban areas: 30% walk / 24% cycle  Other urban areas: 24% walk /19% cycle  Accessible small towns: 26% walk 13% cycle	The current average proportion of journeys walked / cycled are:  Large urban areas: 24% walk / 1.5% cycle  Other urban areas: 19% walk / 0.4% cycle  Accessible small towns: 20% walk / 0.5% cycle  Within existing parameters, walking can be expected to increase in the least affluent communities by an additional 1% point, and cycling by 2-4% points	Improve the proportion of facilities that are within walking/cycling distance of communities.  Improve walking and cycling opportunities to local facilities
Reduce transport emissions in declared air quality management areas	National Emission Ceiling Directive <sup>vi</sup> thresholds are reflected in Crieff, Dundee City and Perth City Air Quality Management Plans and Dundee Low Emission Zone. Including. NO <sub>2</sub> annual mean (not to exceed 40µg m-3) number of NO <sub>2</sub> exceedances (200µg m-3 not to be exceeded more than 18 times a year)	Our towns & cities serve large rural hinterlands. 60% of trips made by those living in the region are by car (2019)	Support the introduction and adoption of low and zero emission technologies  Reduce the number of car journeys in our towns through promoting walking, cycling and public transport
Improve ability of all in the least affluent SIMD data zones targeted by the respective Council to access jobs, education and services	% of employed adults who could use public transport for work in least affluent areas to be equal to or better than the average for the Council area <sup>vii viii</sup>	Access to affordable transport is identified as a key driver of Child Poverty.  Limited public transport services in many localities and limited ability to influence commercial fares	Improve the proportion of facilities that are within walking/cycling distance of communities.  Improve public and shared transport opportunities  Improve ability to access and use public and shared transport opportunities

Key RTS Outcomes	Proposed Regional Target	Scale of the challenge	What needs to be done
Improve journey times and journey time reliability on strategic road and rail routes to key destinations for (a) public transport (b) freight	Improve public transport journey time and journey time reliability on key bus corridors in accord with the Bus Partnership Fund bids  Ensure journey time reliability to key freight origins/destinations remains with 95% of average journey time	The region is both peripheral to the central belt, as well as accommodating almost all surface trips to North-East Scotland and the Highlands and Islands	Reduce the number of trips passing through the pinch points on our strategic routes

This report provides an evidence base for these targets, and a commentary on their implementability. Its structure addresses first those relevant regional targets which follow directly from Government targets/aspirations (reducing carbon emissions/increased share of low emission vehicles; reducing car-km; increasing walking and cycling in deprived communities), and then those which are additional regional aspirations (improving accessibility in more deprived communities; improving journey time reliability).

Note that targets relating to two of the key outcomes are excluded from this report. They, and the rationale for their exclusion, are:

- Reduce fatalities and injuries: progress and actions in relation to this are established by Scotland's Road
   Safety Framework to 2030 and by local authorities in the region;
- Reduce transport emissions in declared air quality management areas:

# 2. Targets relating to Government targets/aspirations

# 2.1 Reduce carbon emissions/increase share of low emission vehicles

RTS target	Reduce emissions from transport in line with the national to Promote Ultra Low Emission Vehicle (ULEV) adoption to ac	
Baseline data	It is estimated that transport is responsible for 35.6% of carbon emissions in Scotland <sup>ix</sup> .  Net emissions of greenhouse gases by transport allocated to Scotland were 13.9 MtCO <sub>2</sub> e in 2019, of which 66% was from road transport, and 14% from international aviation/shipping <sup>x</sup> .  The sources of transport emissions are as shown in the graph:	Buses & coaches, 3%  Domestic Shipping and Maritime, 14%  International Aviation and Shipping, 14%  Railways, 1% Other road, 0% Mopeds & Mopeds & Mopeds & Wehicles, 12%  Light Goods Vehicles, 12%

According to Scottish Government data<sup>xi</sup>, carbon emissions from transport has fallen by only 6.7% in the period from 1990 to 2019 (total emissions from all sectors fell by 43.8%).

Moreover, transport emissions were no lower in 2019 than 2015:

Year	Carbon emissions from transport (MtCO2e)	Annual emissions as proportion of 1990 total
1990	14.9	100%
2015	13.8	93%
2016	14.2	95%
2017	14.5	97%
2018	14.3	96%
2019	13.9	93%

The average age of the car/van fleet in Scotland in 2020 was 7.6 years<sup>xii</sup>, hence there is the expectation that nearly half of the current vehicle fleet will be replaced between 2023 and 2030.

In the year to July 2023, 17.7% of the new cars sold in Scotland were fully electric<sup>xiii</sup>; this is a substantial increase on historic proportions (for example, the equivalent level in 2020 was 6%), but ULEVs currently still make up only around 2.5% of all cars in the UK<sup>xiv</sup>.

### External targets

The Climate Change Plan Update, as was current at the time of finalisation of Tactran's RTS,  $^{xv}$  required the transport sector to reduce emissions by 56% by 2030 on the 1990 baseline, to 6.5 MtCO<sub>2</sub>e – but this includes aviation and maritime, modes largely outwith the influence of the RTS. A summary of the emissions reduction effort across transport sectors (relative to 2018) is set out as Policy Scenario 3 in research into Decarbonising the Scottish Transport Sector, undertaken for Transport Scotland<sup>xvi</sup>, and is shown below:

Sector	Emissions saving by 2030 (%)	Emissions saving by 2040 (%)	Emissions saving by 2045 (%)
Car	78%	98%	100%
Bus and Coach	79%	96%	100%
Rail	42%	100%	100%
Vans	47%	95%	100%
Trucks	52%	89%	100%

However, since the publication of the RTS, the Scottish Government has agreed with the Climate Change Committee's (CCC) rearticulation that the 2030 target for emissions reduction is not achievable<sup>xvii</sup>, but no new targets have been announced. There are thus currently no national targets for emissions reductions in place.

#### Local Authorities' Carbon Aspirations

#### Angus Council (AC)

- AC declared a climate emergency in September 2019
- AC do not have their own specific carbon reduction targets, but are working towards the Scottish Government's targets
- AC's Sustainable Energy and Climate Action Plan was approved in November 2021. The plan comprises seven key sectors: Buildings, Energy, Transport, Land Use & Forestry, Agriculture & Food, Waste, and Governance & Process, but does not contain any specific targets

### **Dundee City Council (DCC)**

- DCC declared a Climate Emergency in June 2019
- A partnership Climate Action Plan was published in 2019 which commits to surpass the Covenant of Mayors target of 40% reduction in greenhouse gas emissions by 2030 and achieve net-zero greenhouse gas emissions by 2045 or sooner, in line with the proposed targets of the Scottish Climate Change Bill
- Two performance indicators will be used to measure emissions reduction progress against the target: total carbon dioxide equivalent (CO2e) emissions (total and by end-use) in Dundee, and per capita (person) CO2e emissions in Dundee
- The plan comprises four key themes, each of which contains a number of actions and targets: Energy, Transport, Waste and Resilience
- Transport accounted for 25% of total CO2 emissions in Dundee in 2015
- The key objective for transport is to "encourage active travel through walking, cycling and public transport and deploy sustainable alternatives to decarbonise transport"

### Stirling Council (SC)

- SC declared a climate emergency in October 2019
- SC's Climate and Nature Emergency Plan (2021-2045) has two targets: Stirling Council will be carbon neutral in its own operations by 2035, and the Stirling Council area will achieve 'net zero' carbon by 2045
- The plan comprises five sectors, each with its own main objective: Energy Use & Generation, Transport, Resource Efficiency, Nature & Biodiversity, and Climate Adaption
- The main transport objective is to "develop a modern transport system that minimises carbon emissions, improves affordability, and provides choice for all"
- There are four priorities that sit within the transport objective:
  - o Make every trip in the Stirling area net-zero carbon
  - o Make walking and cycling easy, safe, and attractive travel options

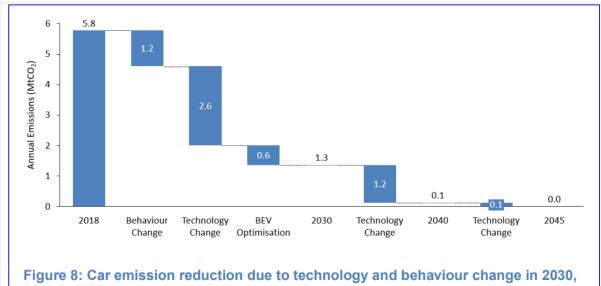

- o Help enable an effective, affordable public transport network
- o Maximise sustainable choices for all
- The plan sets out the following transport performance indicators and interim and 2045 targets (^ indicates NTS2 targets and \* indicates targets from the Climate Change Act)

Indicator (against a 2019 baseline)	Interim target	2045 target
Area-wide targets		
% reduction in carbon emissions from road traffic in the city area (1,608 tCO2 a year across monitored AADT routes)	More than 40% by 2032^	75%^
% of city centre journeys by active travel (against modal cordon count of 15.4%)	At least 20% by 2030^	Increase of 30%^
% of Ultra Low Emission Vehicles (2.2% of all vehicles registered in Stirling in 2019)	45% by 2032	100%
% patronage increase in public transport (2.3m boarding 2019-20)	25% by 2030	50%
% reduction in carbon emissions from public transport (3,842 tCO2 in 2019-20)	25% in 2030	75%
Council targets		
% of Stirling licensed taxis which are EVs (0% in 2019)	100% of new licenses by 2032	100% of all taxis operating in the area to be EV
% Council vehicle fleet running on 'clean' energy (3.1% in 2019)	Phase out new petrol and diesel light commercial vehicles by 2025*	100% of all fleet clean by 2030*
% reduction in carbon emissions from Council business travel (4,450 tCO2 in 2006/07 baseline year)	45% by 2030	90%

### Perth and Kinross Council (PKC)

- PKC declared their support for the Scottish Government and UK Parliaments' climate emergency statements in 2019
- Climate Change Strategy and Action Plan was adopted by P&KC in December 2021 and commits to achieving Net Zero in line with the Paris Agreement and the Scottish Government Targets by 2045, with the ambition of achieving them sooner
- Transport emissions account for 52% of total CO2 emissions across Perth and Kinross, with cars providing 45% of these emissions, LGVs and HGVs providing 23% each, and trains providing the remaining 9%
- The plan comprises eight key areas: Transport, Buildings & Energy, Business & Industry, Waste & Circular Economy, Land Use, Climate

	Resilience, Education & Engagement, and Governance, but does not contain any specific targets:					
Potential costs and timescales for	Delivering emissions reductions from those elements within the scope of the RTS (largely surface transport) is expected to require at least the following:					
delivery	1. Substantial investment to reduce demand for transport;					
	2. Substantial investment to enable decarbonisation of transport, including the rail network and facilities for electric vehicle charging;					
	3. Substantial investment to increase the capacity, quality and availability of more sustainable modes;					
	4. Regulation to limit the use of less sustainable options.					
	Item 1 is addressed in the next section of this report. Item 4 will largely be within the remit of national government, rather than Tactran or its					
	regional partners.					
	The RTS could, however, help deliver items 2 and 3, but major capital and revenue investment will be required to fully achieve the extent of potential carbon reduction across the region. The scale of potential investment in active travel is referenced in section 2.3, and that for public transport in 3.1. Comprehensive delivery of active travel infrastructure is considered to be a multi-decade programme. Much public transport improvement could be delivered relatively swiftly, but only in the situation where significant revenue funding support is available.  Decarbonisation of transport operations is addressed by the national Rail Decarbonisation Action Planxviii and by various EV charging strategies and plans, including that of Tactranxiix. The investment costs and timescales for these are presently unclear, and whilst Tactran and local partners can help improve attractiveness of EVs through provision of chargers, issues relating to purchase and operating costs will rely on action by Scottish and/or UK Governments.					
What could be achieved by 2030	The Scottish Government no longer considers that its overall targets for carbon reduction by 2030 are achievable. Although they have not commented on emissions from specific sectors, the recent analysis by the CCC <sup>xx</sup> suggests that they consider the targets for transport (as set out under 'Extant Targets' above) to be unachievable. Neither the Scottish Government nor the CCC have provided updated forecasts of anticipated emissions in 2030.					
	As the Tactran region displays broadly similar characteristics in terms of overall population density and settlement patterns to the Scottish average, it is assumed that the national targets are unachievable in the region.					
	Emissions reductions from rail in the region may be able to exceed the national targets, as the Rail Decarbonisation Action Plan suggests that all					
	rail lines in the Tactran region are to be electrified by 2030.					
Potential business- as-usual outcome by 2030	Emissions from cars were anticipated to be reduced in part by the 20% reduction in car-km, but to a greater extent by technological changes, as indicated in the Decarbonising the Scottish Transport Sector report <sup>xxi</sup> :					

2040 and 2045.

However, as work for Tactran to investigate the 20% car-km target has demonstrated to reduce car use is achievable by 2030 but only with significant increases in both political will and funding. The research concluded that, without these changes, car-km in the region would be 10-15% greater in 2030 than 2019, and that business-as-usual action might reduce this by only around 1.5% (resulting in a business-as-usual net increase in car-km between 2019 and 2030 in the range of 8.5-13.5%).

The availability and affordability of technological changes also cannot be guaranteed. The achievement of the carbon target that was in place until recently assumed that 73% of cars operating in Scotland in 2030 would be ULEV, up from the 0.5% of 2020, despite the current average age of the fleet being longer than the period to achievement of the target.

17.7% of cars sold in the UK in the year to July 2023 were electricxxiii. Even if this proportion doubled to one third of all cars by 2024 and was sustained for the rest of the decade, then only around 23% of the total fleet would be ULEV by 2030 (assuming the average age of the vehicle fleet remained unchanged). If the current 17.7% proportion of new cars being electric was sustained throughout the decade, then only around 13% of all cars would be ULEV by 2030.

Some reductions in emissions per km from the non-ULEV fleet would also be expected (with new cars emitting less than older ones), but net reductions of emissions per car-km are not expected to exceed around 30%.

Even if all the cars sold from 2024 were electric then the proportion of the fleet that would be electric by 2030, assuming the average age of the car fleet remained the same, is around 65%.

Summarising the above, the expectations of business-as-usual outcomes are:

- For net car-km in the region to increase in the range of 8.5% to 13.5%;
- For emissions per car-km to fall by 30% or less.

This results in a maximum reduction in emissions from car use of 24% (=  $(1+8.5\%) \times (1-30\%) - 1$ ); a lesser reduction would result if the number of car-km was greater than the level suggested or the emissions per km greater.

Total net carbon emissions from car, therefore, are expected to fall in a business-as-usual scenario, but not by more than around 35% (~ 1.085% to 1.135% x 30%), and potentially less if the take up of ULEVs is lower than assumed here.

If the 24% reduction in emissions from car was achieved, rail in the region was fully decarbonised and bus and commercial vehicle fleets met their national targets for reduction in line with the Decarbonising the Scottish Transport Sector report, then net potential emissions reductions by 2030 could be:

Sector	1990 emissions (MtCO2e)	2019 emissions (MtCO2e)	Potential reduction by 2030	2030 emissions (MtCO2e)
Car	5.79	5.28	24% (from calculations above)	4.02
Bus and Coach	0.60	0.43	79% (assuming national target achieved)	0.09
Rail	0.12	0.15	100% (assuming rail is decarbonised as planned)	0.00
Vans	0.96	1.71	47% (assuming national target achieved)	0.90
Trucks	1.79	1.72	52% (assuming national target achieved)	0.83
Totals	9.25	9.29		5.84

This is considered to be a 'best case' scenario (as achieving all the targeted reductions from public and freight transport will be challenging). If it were achieved, then emissions from surface transport in 2030 will be 63% of those in 2019 (and 63% of the 1990 baseline emissions level from the same modes). This equates to a reduction of 37%; significantly less than the 56% national target which has been adopted for the RTS (noting that the analysis above excludes consideration of maritime and aviation modes).

Commentary on achievability of proposed target

Achievement of the RTS target relies on both reductions in emissions per car-km and in the number of car-km that are greater than are anticipated under a current 'best case' scenario in the Tactran region, and also the achievement of challenging reductions from other surface transport modes. The target is not therefore considered to be achievable.

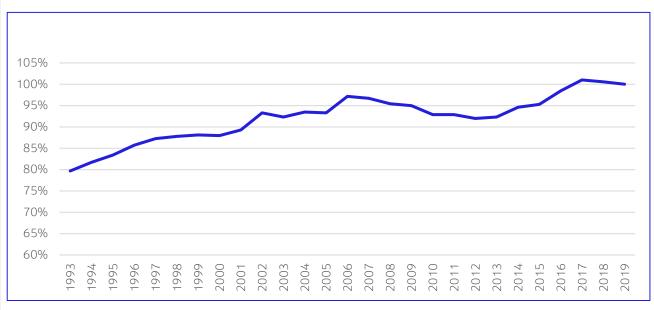

### 2.2 Reduce car-km driven

RTS target

Reduce car kilometres driven in line with the national target of reducing car km driven by 20% by 2030 (compared to 2019 levels)

Baseline data<sup>xxiv</sup>

In 2019, around 4,500 million car-km were driven in the Tactran region, an average of nearly 9,000 car-km for each resident. Traffic levels in the region have increased significantly in recent decades. Department for Transport data for the region, suggests that to achieve a 20% reduction in traffic compared to 2019 levels would be equivalent to typical flows not seen since the early 1990s.

Average car use per person varies significantly across the region, with use generally greater by residents of more rural areas, where average journey distances tend to be greater, and available alternatives fewer. Car use per person in the region is around 30% greater than the Scottish average:

Council area	Population	Land area (km²)	Million car-km (2019) <sup>xxv</sup>	Car-km per person (2019)
Angus	115,820	2,181	870	7,512
Dundee	148,290	60	663	4,471
Perth & Kinross	151,910	5,286	1,906	12,547
Stirling	94,080	2,186	1,040	11,054
Tactran	510,100	9,713	4,479	8,781
Scotland	5,466,000	77,901	36,747	6,723

Long journeys comprise a small proportion of all car trips, but a large proportion of car-km. The Tay Cities Regional Transport Model (TCRTM) estimates that journeys of more than 20km comprise less than a fifth of all journeys made in the region but over half of all the car-km:

Distance	Proportion of car journeys	Proportion of car-km
Under 1km	11%	1%
1km to 2km	12%	2%
2km to 3km	9%	2%
3km to 5 km	12%	4%
5km to 10km	21%	13%
10km to 15km	11%	11%
15km to 20km	7%	10%
20km to 30km	8%	16%
30km to 40km	4%	10%
Over 40km, including cross-regional journeys	6%	32%

The largest proportion of car-km by journey purpose are from leisure (34% of all car-km), commuting (25%) and shopping (13%), with the remaining 28% split between other purposes.

Car use per person is significantly correlated with income: people in the highest income bands typically travel than three times more car-km than those in the lowest.

### External targets

The Scottish Government, in its Climate Change Plan, has committed to reduce the number of car-km travelled on Scotland's roads by 20%, in comparison with a 2019 baseline, by 2030.

# Potential costs and timescales for delivery

A wide range of options that may be able to reduce car-km has been considered as part of the options review for Tactran, and quantitative estimates of their potential effects made. Options include measures to improve alternatives to car use, to reduce the demand for overall travel, and to disincentivise car use.

The assessment has shown that:

- Investment in and encouragement to use alternatives to car use are highly unlikely, even if significant additional funding were to be made in addition to that currently available, to reduce the number of car-km in the Tactran region below that of 2019, let alone get close to the 20% target;
- Regional partners have the powers to introduce measures that would significantly reduce car use. These measures, however, are likely to be unpopular locally and would not be sufficient, even if accompanied by significant investment in alternatives to car use, to achieve the 2030 car-km target;
- Measures to discourage car use will have adverse distributional impacts, with some people facing significant changes to their travel habits (largely dependent on their income and extant travel needs), but some others unaffected. These impacts could be mitigated in part by investments in alternatives to car use, in order that people unable to continue to drive could make at least some of their journeys by other means.

The assessment concluded that additional traffic restraint measures, outwith the control of regional partners, were required in order for the target to be met, and that a national road pricing scheme would be a likely option for this. This would have a significant up-front capital cost requirement, but which could be recouped from charges paid.

A road pricing scheme would also be likely (depending on the scale of charges required to meet the target) to provide an on-going revenue stream to support investment in other sustainable transport choices, most notably to reduce adverse impacts for those no longer able to drive. Given that Transport Scotland has committed to publish an updated route map to the achievement of the target within 2024, it is assumed that they will identify a mechanism by which it will be delivered. As outlined in sections 2.3 and 3.1 of this report, however, delivering improvements in active travel will require longer timescales (potentially of many decades for comprehensive delivery of active travel investments).

What could be achieved by 2030	The assessment demonstrated that locally-led action could, as a best case, result in car-km in the region in 2030 being around 92% of that in 2019 (this relying on significant investment and strong local willingness to restrain car use).
Potential business- as-usual outcome by 2030	The business-as-usual forecast is for car-km in the region in 2030 to be 115% of those in 2019, as a result of population and economic growth, and anticipated limited introduction of measures to restrain car use.
Commentary on achievability of proposed target	The assessment concluded that there was no scenario by which the target would be met by the action of regional and local partners alone, and that action by others to constrain car use (options for which the introduction of a national distance-based road pricing scheme appears to be most effective) would be required. This would need to reduce car-km from the levels achieved by local actions by between 13% (best case) and 30% (worst case).  The Scottish Government has committed to publish an updated route map to the achievement of the 20% target within 2024. It is currently to
	be assumed that this route map will set out a mechanism by which the target will be delivered throughout Scotland, and hence that the regional target is achievable.

# 2.3 Physical activity in more deprived communities

RTS target	For the least affluent SIMD data zones to achieve the Transport Scotland's forecasts for average proportion of journeys walked and cycled by 2030  Large urban areas: 30% walk / 24% cycle  Other urban areas: 24% walk /19% cycle  Accessible small towns: 26% walk 13% cycle
Baseline data	The extant baseline of walking, wheeling and cycling in more deprived communities is not detailed/robust, and datasets are sometimes conflicting.  Active travel comprises around 20% of all minutes of physical activity*xxvi.

Extrapolation of Scottish Household Survey Travel Diary Survey data<sup>xxvii</sup> and market research on travel patterns recently undertaken by Tactran suggests the following modal shares, and that people living in more deprived communities do walk and cycle proportionately at least as much as the regional average (though the average number of journeys made by them is lower):

	Regional average	SIMD 1&2 – Most deprived	SIMD 3&4	SIMD 5&6	SIMD 7&8	SIMD 9&10 – Least deprived
Walking	22%	25%	25%	24%	20%	17%
Driver car/van	53%	41%	46%	51%	56%	65%
Passenger car/van	12%	13%	13%	12%	12%	10%
Bicycle	1%	2%	1%	1%	1%	1%
Bus	7%	12%	10%	7%	6%	3%
Taxi/ minicab	1%	2%	1%	1%	1%	1%
Rail	2%	4%	3%	2%	3%	2%
Other	1%	1%	1%	1%	1%	1%
Relative number of journeys made	100	81	91	102	107	111

However, almost all of the most health deprived communities in the region are in urban areas, where rates of active travel are higher than average because of the typically shorter journey distance in towns and cities. When this is accounted for, there does appear therefore to be some correlation between deprivation and lower levels of walking and cycling.

Anecdotal evidence collected by Jacobs staff during extensive engagement in communities in the region suggests that, in more deprived communities:

- Low levels of income and typically short journeys distances force or enable many people that live in more deprived communities to undertake a high proportion of their journeys by active modes, especially on foot; but
- In these more deprived communities, a higher proportion of people are unable to walk or cycle because of mobility impairments and poor health, so may be dependent on motorised modes if they are able to travel at all.

### External targets

Chief Medical Officers' physical activity targets, which are complex and different for different age groups, include for adults (19 to 64 years): "For good physical and mental health, adults should aim to be physically active every day. Each week, adults should accumulate at least 150 minutes (2 ½ hours) of moderate intensity activity (such as brisk walking or cycling); or 75 minutes of vigorous intensity activity (such as running); or

even shorter durations of very vigorous intensity activity (such as sprinting or stair climbing); or a combination of moderate, vigorous and very vigorous intensity activity"xxviii.

Scotland's Physical Activity Delivery Plan sets out a "target of achieving a 15% relative reduction in the global prevalence of physical inactivity in adults and in adolescents by 2030"xxix.

Local authority active travel targets:

- Stirling LTS\*\*\* Proportion of people accessing Stirling City Centre on foot: 10% increase compared to 2017 levels; % increase of annual average daily total of cyclists on monitored routes: 50% increase compared to 2017 levels;
- Angus ATS\*\*\*: For the proportion of Angus residents walking for utility journeys weekly or more often to be at least equal to the Scottish average by 2034; For the proportion of Angus residents cycling for utility journeys weekly or more often to be greater than 10% by 2034;
- Perth's Transport Future: One of the strategic objectives is to Increase the proportion of short trips by more sustainable modes setting out targets to achieve a: 5% increase in cycling; 20% increase in walking;
- PKC ATS\*\*\*\*\*: Perth & Kinross Council and its partners will seek to: Increase the number of journeys made on foot across Perth and Kinross as recorded in the 2011 Census for Scotland; Increase the number of journeys made by bike in Perth and Kinross as recorded in 2011 Census for Scotland; Increase the proportion of residents of Perth and Kinross walking more than 30 minutes in one go per month by 5% by 2028 in comparison with a 2018 baseline; Increase the proportion of residents cycling monthly or more often in Perth and Kinross by 50% by 2028 in comparison with a 2018 baseline;
- Dundee Cycling Strategy: Dundee City Council and its partners will aim: To increase the number of journeys made by bike annually in Dundee by 200% by 2026 in comparison with the 2016 baseline, with an interim target of 100% by 2021; To increase the number of Dundee residents cycling monthly or more often by 100% by 2026 in comparison with the 2016 baseline, with an interim target of 50% by 2021; For the number of cyclist casualties in road crashes in Dundee, as reported by Police Scotland data, to be no higher in any year than the 2010-14 average; and To increase the number of children who cycle to school by 100% by 2021 in comparison with the 2014 baseline data.

In summary, there is an extensive range of extant targets to increase levels of physical activity and rates of active travel, but few if any focus specifically on achieving improvements in deprived communities.

Potential costs and timescales for delivery

Transport Scotland's recent Scottish Transport Projects Review (STPR2) made forecasts<sup>xxxiv</sup> (by local authority and urban/rural classification, not specifically by health or community deprivation level) of what could be achieved by long-term, comprehensive investment in high-quality active travel facilities. These are listed below but are valid only if "all the active travel and behaviour change interventions were fully implemented in every relevant location in the region" (quoting STPR2). Evidence from other countries that have greater experience in designing for active travel suggests that achieving these outcomes comprehensively across regions takes many decades of effort and investment, hence these forecasts are considered to be deliverable only the long term.

Local Authority	Average proportion of all journeys walked		Average proportion of all journeys cycled	
Baseline		Forecast following comprehensive delivery of high quality active travel investment	Baseline	Forecast following comprehensive delivery of high quality active travel investment
Angus	17%	22%	0.7%	19%
Dundee City	24%	30%	0.7%	23%
Perth and Kinross	17%	20%	0.5%	15%
Stirling	17%	21%	0.5%	18%
Regional average	19%	23%	0.6%	19%

Urban-rural 6-fold classification	Average proportion of all journeys walked		Average proportion of all journeys cycled			
	Baseline Forecast following comprehensive delivery of high quality active travel investment				Baseline	Forecast following comprehensive delivery of high quality active travel investment
Large Urban Areas	24%	30%	1.5%	24%		
Other Urban Areas	19%	24%	0.4%	19%		
Accessible Small Towns	20%	26%	0.5%	13%		
Remote Small Towns	24%	31%	0.7%	11%		
Accessible Rural	12%	14%	0.4%	7%		
Remote Rural	15%	16%	1.0%	7%		
Scotland total	19.9%	24.9%	1.4%	19.1%		

Impacts on more deprived communities would depend on local and regional decisions about where investment in the region is targeted, but it is reasonable to assume that, in the long term, the proportional rates of increase in walking and cycling indicated in the tables above could be achieved; i.e. that investment could increase the amount of walking by around 25% (= (24.9% / 19.9%) - 1) and cycling by 1300% (= (19.1% / 1.4%) - 1).

The investment required to achieve the active travel outcomes forecast by STPR2 across all of Scotland is in the range of  $\pounds 7$ -14bn.

Tactran's regional population = 511k, 9% of Scotland total. Tactran's region = 9,900 sqkm, 12.5% of Scotland total.

Hence if Tactran warrants ~10% of national total spend on active travel (based on a proportional allocation in line with population and area), then there is a budget requirement of £700-1,400M required to deliver the high quality infrastructure throughout the region on which the forecasts above are based.

However, this estimate would allow for delivery throughout the region, not just for the more deprived communities. If active travel measures were to be focussed on the most deprived 20% datazones in the region, then approximately 20% of the total regional budget allocation would be required to deliver improvements within them, but some additional allocation would be appropriate to provide good connections between those communities and their town/city centres and other nearby destinations. If 30% of the net regional cost is therefore relevant to more deprived communities, then a total spend in the range of around £200-400M would be required to meet the target.

Those countries or regions that are renowned for developing high quality active travel facilities have found that comprehensive delivery is a multi-decade endeavour, and it is expected that this would be the case in the Tactran region.

# What could be achieved by 2030

Active travel improvement measures are largely feasible and typically enjoy public support. Almost all are within the control of local and regional partners.

The Scottish Government has committed to invest £320M per annum on active travel. If 10% of this came to the Tactran region, then potential investment of around £30M per annum may be possible in the region. If this came fully on stream by 2027 (reflecting the requirement for Local Authorities and other partners to build capacity for implementation and currently-observed challenges in scheme development nationally) with investment at a lower level until then, then it might be reasonable to assume that a total of around £140M could be invested by 2030, around one tenth to one fifth of the potential long-term region-wide investment requirement of £700-1,400M.

It could therefore be expected to increase the mode share of walking in the most deprived communities by approximately one percentage point by 2030 (with the number of walking journeys increasing by 3-6%), and the mode share of cycling in the range of 2 to 4 percentage points (with the number of cycling journeys increasing between one- and three-fold).

However, the long implementation timescales that are typically observed for active travel infrastructure delivery in Scotland are of relevance. Although Transport Scotland is working to implement more speedy delivery processes, recent experience of some of Tactran's local authorities has suggested that it is sometimes taking a number of years to obtain funders' approval even for concept designs. This may limit the potential to deliver increases in active travel by 2030.

### Potential businessas-usual outcome by 2030

At present there is no clear indication that the region's Local Authorities are specifically targeting active travel investment at deprived communities, so it is assumed that likely business-as-usual increases in active travel rates in deprived communities by 2030 would be in the range of one tenth to one fifth of the increases shown in the tables in the section above (i.e. the same as the regional average).

	Given that the baseline level of walking is relatively high but that for cycling low, this suggests only modest increases in the amount of walking in more deprived communities are to be anticipated, but significant proportional growth in cycling could be achieved (from its low base). However, the change achieved will be highly dependent on the types and locations of the schemes to be implemented.
Commentary on achievability of proposed target	The proposed regional target of delivering significant increases in walking and cycling rates in the region by 2030 is considered to be unachievable. The modal share targets for walk and cycle as presented should be considered to be challenging long-term targets, based on the delivery of significant improvements to active travel infrastructure within and between all communities in the region. It is not currently foreseen that sufficient budget will be available to deliver the improvements by 2030 and, even if it was, timescales for delivery of on-going projects suggest that relatively little additional investment can be completed within that period.

# 3. Target relating to regional aspirations

# 3.1 Improve accessibility in more deprived communities

RTS target	% of employed adults who could use public transport for work in least affluent areas to be equal to or better than the average for the Council area
Baseline data	Baseline accessibility data is presented in Appendix A. This shows the areas from which access to a variety of key destinations and services is possible using public transport or active modes. However, as destinations and times of work opportunities are not yet well understood, reliable baseline data to inform the target is not available.
	It is noted that many people are unable to make use of these transport choices, for a variety of reasons including affordability, personal security concerns, social norms and limited travel horizons <sup>xxxv</sup> . Public transport accessibility is limited in many parts of the region, and fares are considered to unaffordable for some people.
	Note also that in their 2016 report into Transport Poverty in Scotland, Sustrans stated that their view was that factors which affect people's poor access to transport are correlated to household income, car availability and access to the public transport network***, and that lack of access to affordable transport is identified as a key driver of child poverty***.
Potential costs and timescales for delivery	Improving transport to improve accessibility in more deprived communities will largely rely on two types of intervention that are within the remit of the RTS: improvements to active travel infrastructure and facilities; and improvements to public transport services. Changes to the locations and/or timings of services or workplaces may also help, but are beyond the direct influence of the RTS.
	Issues relating to active travel are addressed in section 2.3 of this report. Improvements to public transport services are readily deliverable in theory: there is established legislation and commercial bus operators throughout the region are available to respond to Local Authorities' tender requests. Improving public transport accessibility will necessarily rely on dependence on services which are not operating on a commercial basis; they will be at times, on routes, or with specific requirements (such as support whilst travelling) which are not financially sustainable from fares/concessions income. On-going revenue funding by Local Authorities is therefore expected to be required in many instances.
	The magnitude of this funding requirement has not been estimated as part of this review, but it is expected to be high in comparison with authorities' current support for bus services if a significant improvement to accessibility at a regional level is to be achieved.
	Informal discussions with Local Authority officers suggest that they do not envisage significant revenue funding to be available to support bus services for the foreseeable future.

	Improvements to accessibility can be delivered by changes outwith those of the transport sector, if key services and employment are provided in different locations and/or times. Implementing these changes are outwith the scope of the RTS, but joint working with planners (of formal development plans and/or those choosing where education, healthcare and other facilities are provided, may be able to deliver benefits.
Commentary on achievability of proposed target	As no baseline data is available for this target, no commentary on its deliverability provided.

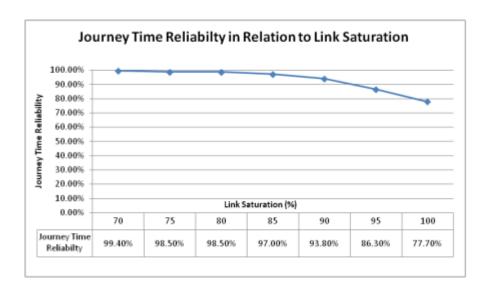

# 3.2 Journey time reliability

RTS target	Improve public transport journey time and journey time reliability on key bus corridors in accord with the Bus Partnership Fund bids Ensure journey time reliability to key freight origins/destinations remains with 95% of average journey time
Baseline data	<ul> <li>The primary concerns for journey time unreliability in the Tactran region are:         <ul> <li>for lorry and interurban coach services in the Tactran region at key nodes on the Trunk Road network;</li> <li>for lorry journeys to key freight origins/destinations away from Trunk Roads;</li> <li>for buses and coaches on congested urban roads.</li> </ul> </li> <li>Note that rail journey time reliability is considered to be entirely within the remit of Network Rail and train operators, and is not considered within this note.</li> <li>Road journey time unreliability is, setting aside the effects of incidents (crashes, roadworks, poor weather, etc) which Tactran have confirmed are outwith the scope of the target, typically a function of network capacity and usage. Road journey time reliability tends to start to become uncertain when traffic flow is more than around 80% of capacity, with more significant effects at more than 90% **xxxviii* (see figure).</li> </ul>

This suggests that, assuming that lorries/buses/coaches are mixed with general traffic, then link saturation of less than around 88% of capacity is required at all points on the transport network for the 95% journey time reliability to be achieved.

Modelled capacity and flow plots for key nodes at peak periods are provided in Appendix B for 2017 and 2032 forecast years (these are taken from the Tay Cities Regional Transport Model which does not include the Stirling area). They show that there are many locations on main routes at which traffic flow is already greater than 88%\*\*xxix\*, and that there is forecast to be many more by 2032. Therefore, without action, delays and journey time unreliability are anticipated to get worse.

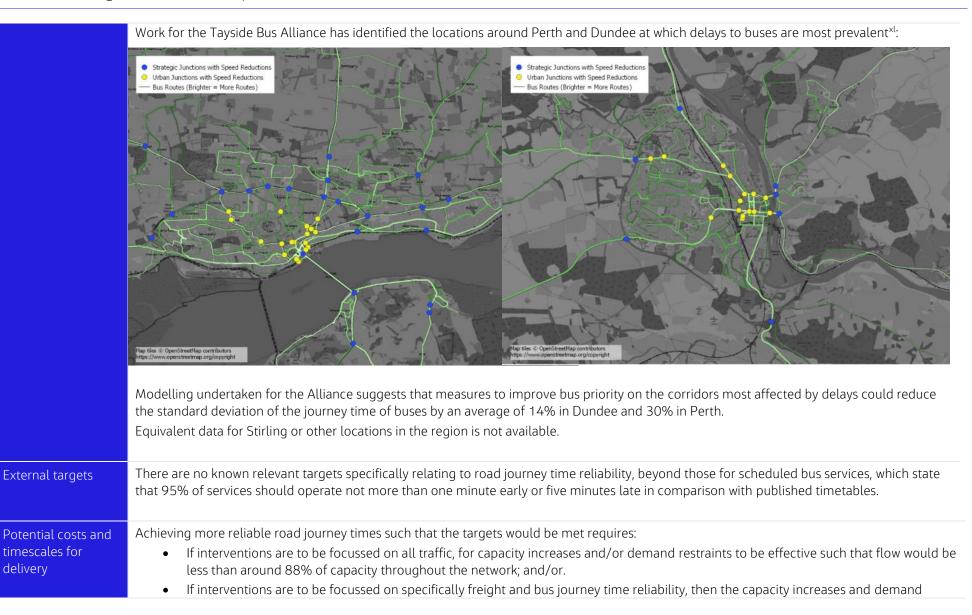

Key sites of concern for freight and interurban coach services are primarily at key nodes on the Trunk Road network (including Keir, Broxden and Inveralmond

junctions, and on the Kingsway and Forfar Road in Dundee), which in turn affect traffic flows on other links as some traffic may route away from these locations on secondary routes. Traffic flows on the Trunk Roads are significantly affected by cross-regional movements between the Central Belt and North/North East Scotland.

As well as the trunk routes and industrial/transhipment sites adjacent to them, key freight origins/destinations in the region include Montrose Port, the Stirling Industrial Estate (accessed from the A91), Arbroath (A92) and many largely agricultural sites accessed from the A94 between Scone and Forfar.

delivery

restraints for general traffic may be effective, or work to be focussed on giving these modes priority over general traffic, for example through bus/lorry lanes.

To deliver flows of less than around 88% of capacity his would require capacity increases and/or demand restraint measures at all congestion hotspots.

Significant road network capacity increases for general traffic are contrary to national and regional policy and are not anticipated to be implementable or fundable within the current policy landscape.

If demand restraint measures were to be effective, they would need to largely target peak-time journeys passing through the congestion hotspots on the Trunk Roads and in the region's cities. If they are unsuccessful at reducing traffic demand at these specific locations then little impact on journey time reliability would be anticipated, even if they affected traffic flows elsewhere.

If the Scottish Government is to lead the implementation of effective measures that would achieve its target for a 20% reduction in car-km (in comparison with a 2019 baseline) by 2030, then this could make a significant contribution to reducing traffic volumes, and hence towards the journey time reliability target. However, as indicated in Appendix C, it is likely that there would be some key nodes (including Broxden, Inveralmond and Swallow roundabouts) could retain traffic flows in excess of 90% of capacity even with 20% fewer car-km. The figures shown in Appendix C also demonstrate that the manner in which the new 20% target is achieved would have a bearing on flow on these main congested links (as some options to achieve the 20% reduction are more likely to influence longer-distance trips – shown as scenario 1 in Appendix C – and some on a larger number of shorter-distance trips – scenario 2).

There are some locations within the region's cities where bus/lorry priority measures may be implementable. The work undertaken to consider bus priority within the region's cities has identified some sites for which positive improvements can be made but has not identified solutions for every congested location (and there has not been, as far as we are aware, any consideration of these being for lorries as well as buses). The implementability of the proposals is understood to be dependent on the availability of Bus Partnership Funding, which is presently paused by Transport Scotland.

Implementing bus/lorry priority on the approaches to the congested Trunk Road hotspots would, in most instances, require either carriageway widening or the reallocation of existing space on dual carriageways in a manner which has not previously been undertaken in Scotland (hard shoulder running to provide bus priority is in operation in some locations in Scotland, but the opportunities to deliver this within the Tactran region are effectively limited to only the northbound approaches to Keir and Broxden roundabouts). Traffic restraint or bus/lorry priority measures on Trunk Roads are implementable only with Transport Scotland consent. Experience of motorway bus priority measures in Scotland suggests that an extended period of consideration and design should be anticipated for any new proposals, which may push implementation beyond 2030.

There are no locations in Scotland at which lorry priority roadspace reallocation measures are currently provided, including no locations in which commercial vehicles are given access to bus lanes. It may be challenging to gain acceptance of change to regulations to enable lorry

	priority.  It is therefore concluded that achievement of this target will rely largely on effective reduction in demand for road use, rather than increases in capacity. Demand management issues are addressed in section 2.2.
What could be achieved by 2030	Significant road network capacity increases for general traffic are contrary to national and regional policy and are not anticipated to be implementable or fundable by 2030.  Work was underway by Tactran and partners to progress bus priority proposals through the Bus Partnership Fund, but the recent pausing of this funding by Transport Scotland has raised doubt about whether they can be progressed in the near future.  It would be challenging to gain acceptance of change to regulations to enable lorry priority by 2030.
	Significant progress towards this target by 2030 is therefore anticipated to require traffic reduction. This is addressed in section 2.2, which concludes with the assumption that the updated route map to the achievement of the 20% car-km reduction, due to be published by Scottish Government/Transport Scotland later in 2024, will identify a mechanism by which the target will be achieved. This will have a significant beneficial impact on journey time reliability within the Tactran region but is unlikely to achieve the 95% journey time reliability target on every route.
Potential business- as-usual outcome by 2030	Given Scottish Government/Transport Scotland's commitment to publish the route map to achievement of the national 20% car-km reduction target, it could be assumed that meeting of the target is the business-as-usual scenario. If, however, the route map does not lead to the delivery of meaningful traffic restraint measures then, as outlined in section 2.2, traffic levels in the region are anticipated to grow by 2030. This will result in less reliable journeys times; congestion at more points on the network and, for extant congestion hotspots, worse unreliability over longer time periods.
	Increasing traffic levels would also tend to worsen public transport unreliability. If the Bus Partnership Fund does not enable delivery of significant bus priority measures within the region, then the business-as-usual outcome is anticipated a further worsening of reliability.
Commentary on achievability of proposed target	The first part of the target (Improve public transport journey time and journey time reliability on key bus corridors in accord with the Bus Partnership Fund bids) appears to be achievable subject if Bus Partnership Funding is unpaused by Transport Scotland, if Dundee City and Perth & Kinross Councils are successful with their applications, and that funding becomes available in time to enable delivery by 2030. There are, however, uncertainties around all three of these assumptions.
	Achieving the second part of the target (Ensure journey time reliability to key freight origins/destinations remains with 95% of average journey time) will depend on a package of measures which:
	<ul> <li>Reduces general traffic flow at congestion hotspots; and/or</li> <li>Increases capacity for general traffic at congestion hotspots; and/or</li> </ul>

• Enables separation of traffic heading to/from key freight origins/destinations from general traffic at congestion hotspots. It is difficult to identify mechanisms that will deliver the outcomes at all or even many of the hotspot locations by 2030 unless there is a significant reduction in traffic flow across the network. This would occur if the Scottish Government's 20% car-km reduction target by 2030 was to be achieved, but forecasts suggest that it is likely that some congestion hotspots would remain even in this case, so it would be unlikely that the target would be achieved in every location in the region without further intervention.

# **Appendix A. Accessibility Data Summary**

The tables below show a baseline of the resident population's accessibility to key services, firstly for the entire region and then separately for each of the four local authorities.

The maps then show the spatial variation of accessibility.

Accessibility is calculated in Jacobs' NaPTAT tool and is defined according to scheduled public transport (based on timetables in spring 2023) or on foot if the relevant walk time is less than an estimated 10 minutes. The data assumes use of the weekday morning (0630-0930) public transport network.

	Tactran Region												
Tactran Accessibility Summary	Population	Households	Households with at least one car	Households with at least two cars	Non-car owning households	5% SIMD	10% SIMD	20% SIMD	16-24	Working age population (16- 66)	66+	Urban areas	Rural areas

## Appendix B. Forecast traffic flow as proportion of capacity: base and forecast years

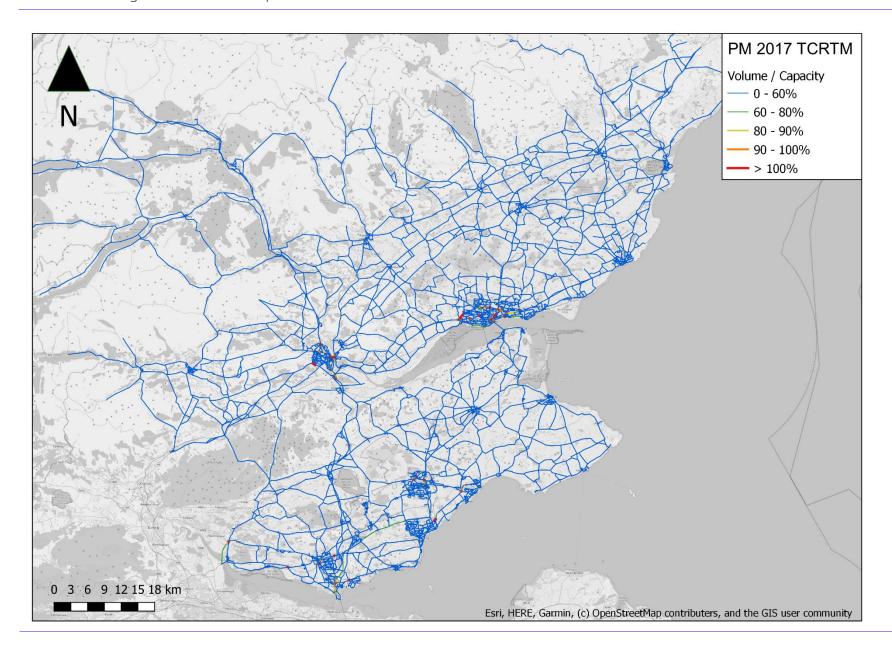

The maps below show the forecast traffic volume as a proportion of capacity on each link in the TCRTM model, for AM and PM peaks in both the 2017 base and 2032 forecast years.

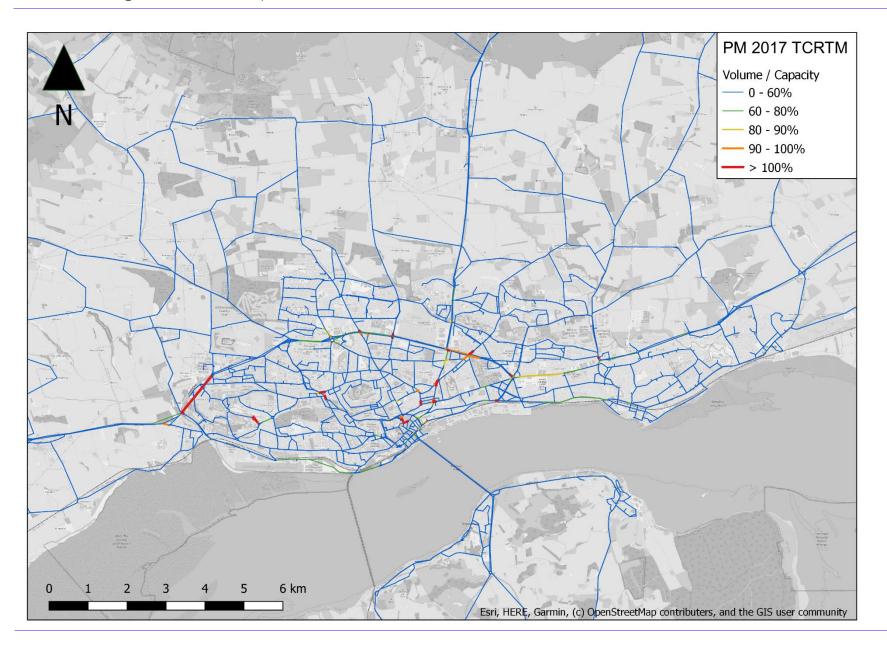

There are three maps for each case, showing the same information at different scales (one the whole network area, then larger-scale maps for the areas around Dundee and Perth.

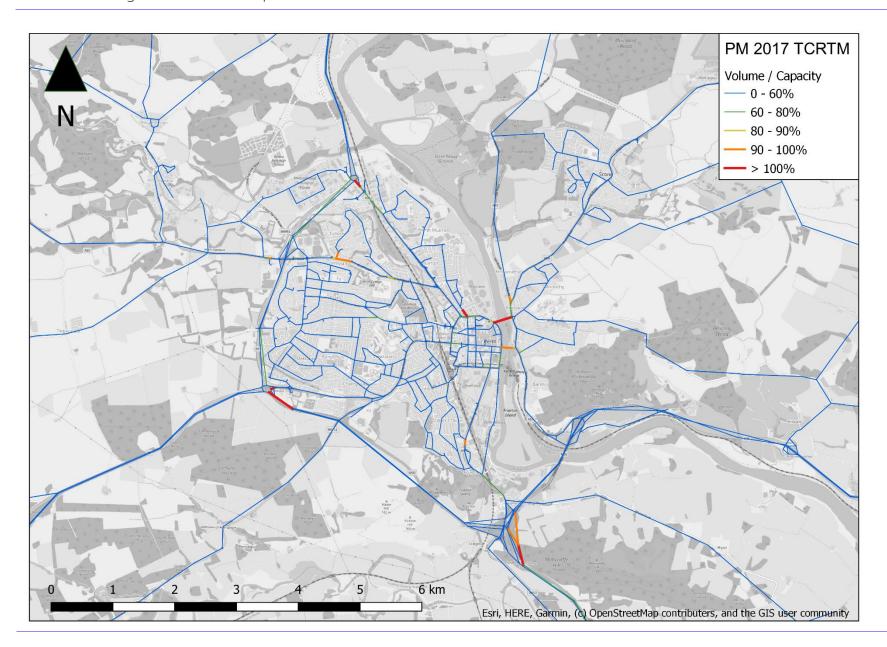

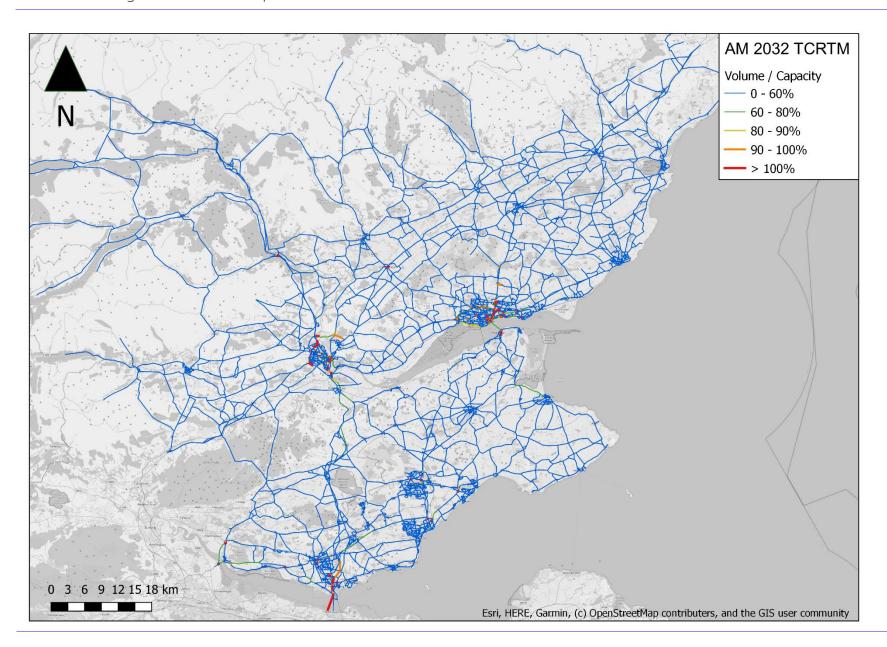

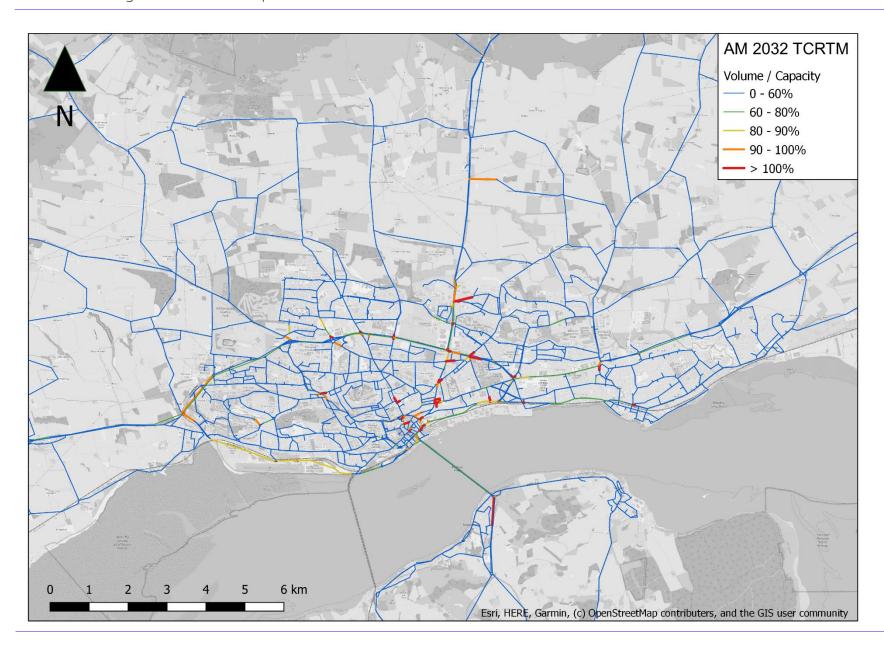

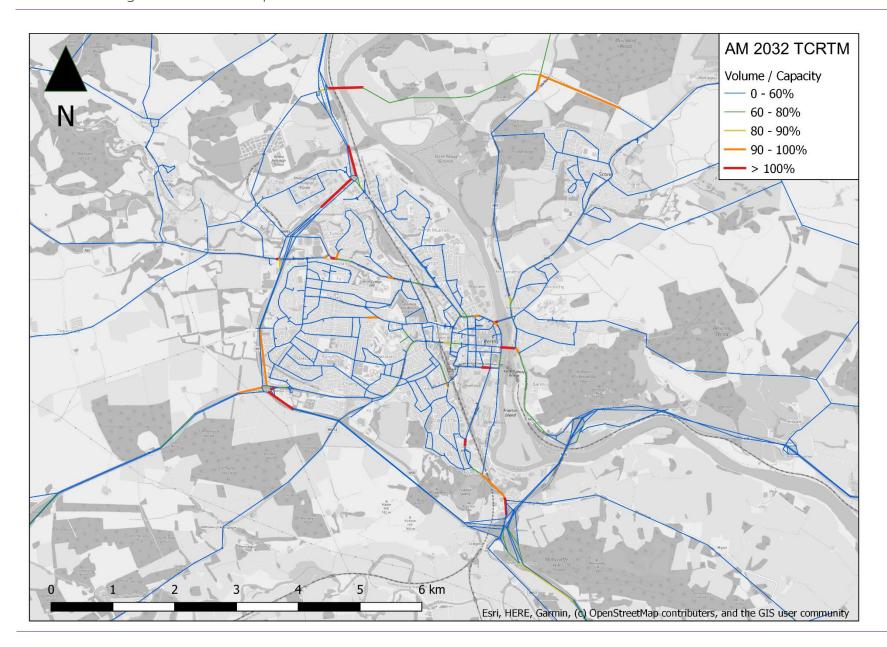

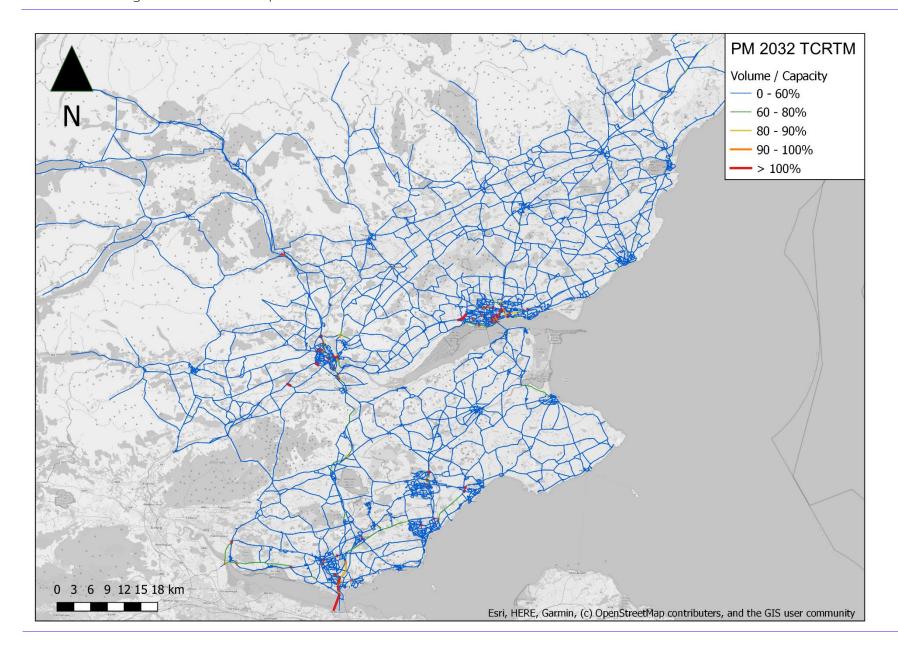

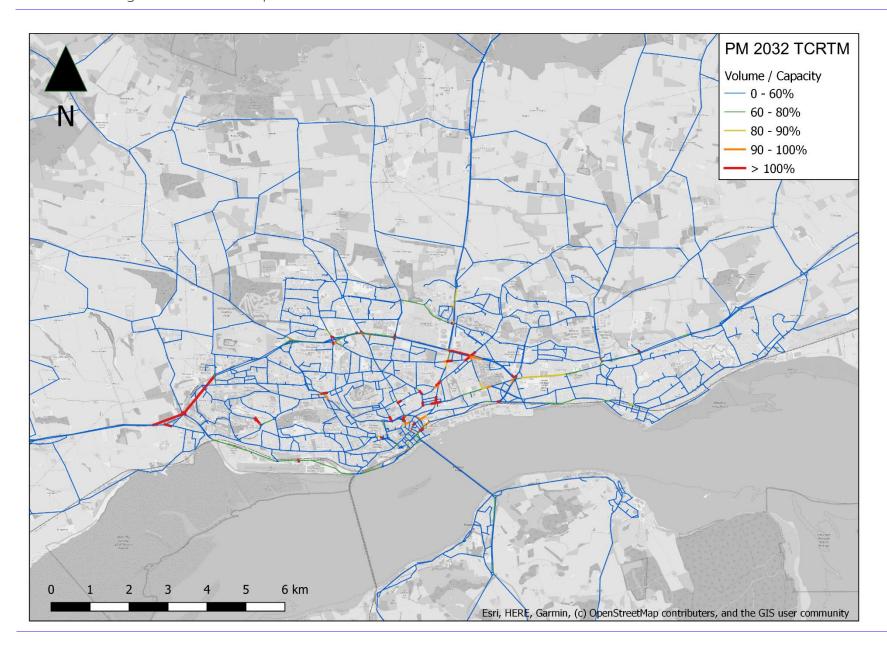

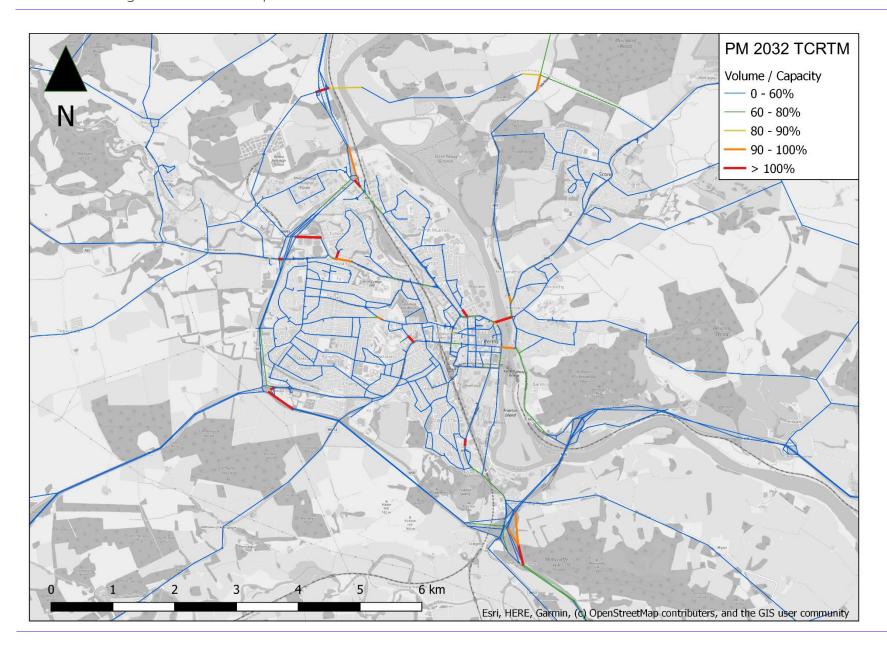

## Appendix C. Forecast traffic flow as proportion of capacity: incorporating 20% car-km reduction

The maps below show the forecast traffic volume as a proportion of capacity on each link in the TCRTM model for the AM peak assuming that the 20% car-km reduction target has been achieved.

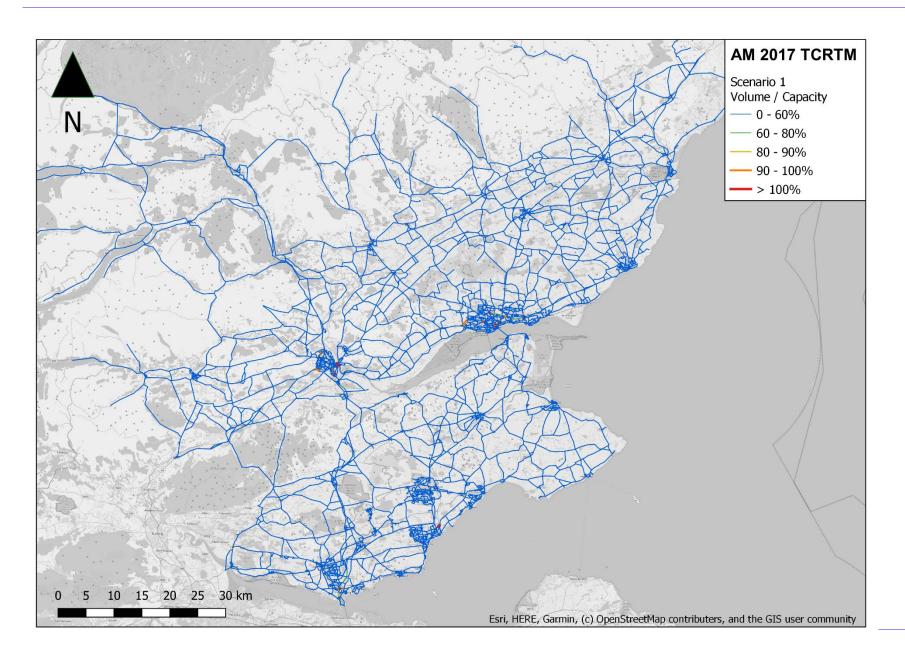

There are three maps for each case, showing the same information at different scales (one the whole network area, then larger-scale maps for the areas around Dundee and Perth.

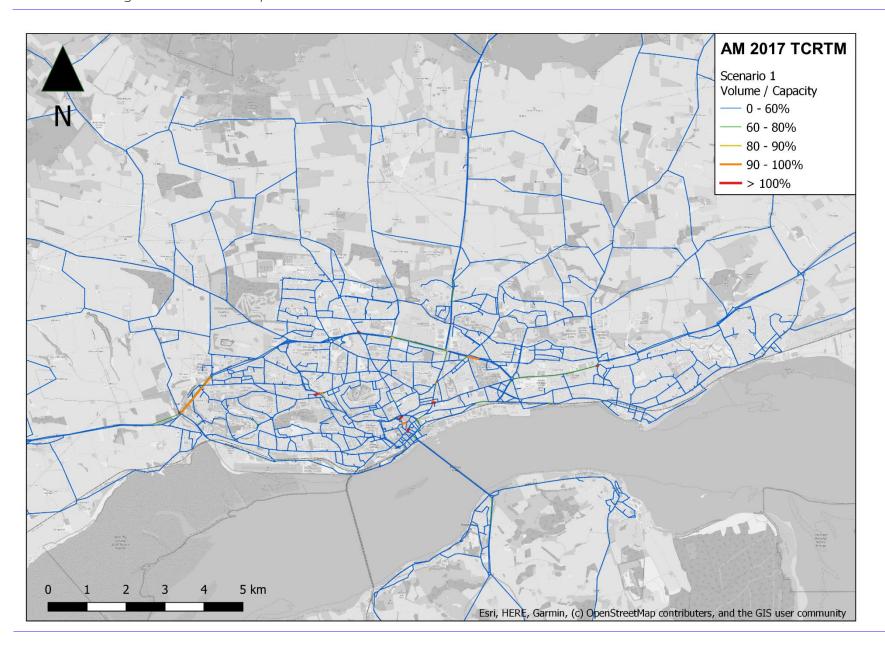

Different scenarios are shown, reflecting the fact that different mechanisms to achieve the overall 20% reduction would have different impacts on travel demand, so affect traffic flows differently.

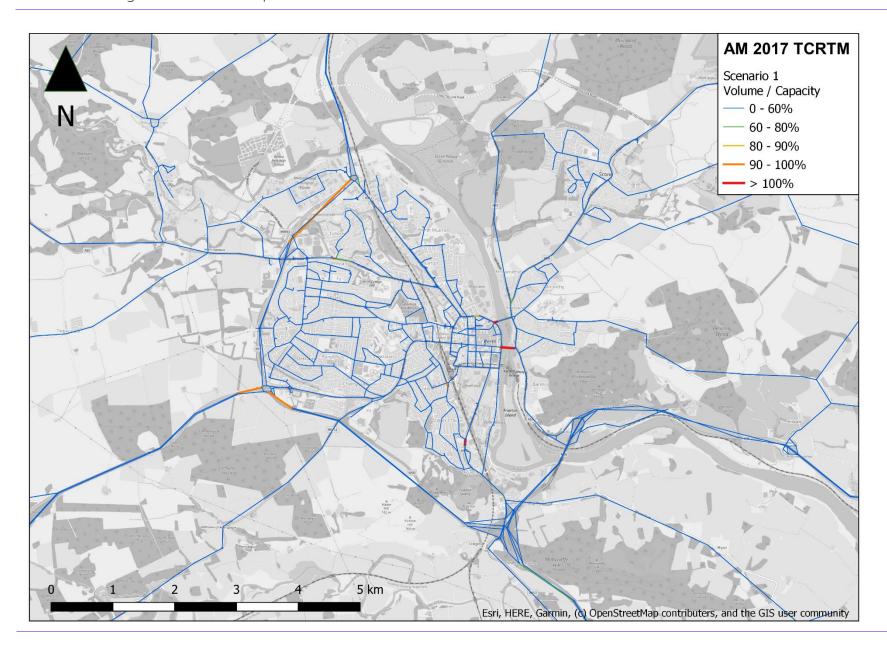

In scenario 1, the full traffic reduction effect is achieved through the introduction of a distance-based road user charge (without any complementary investment).

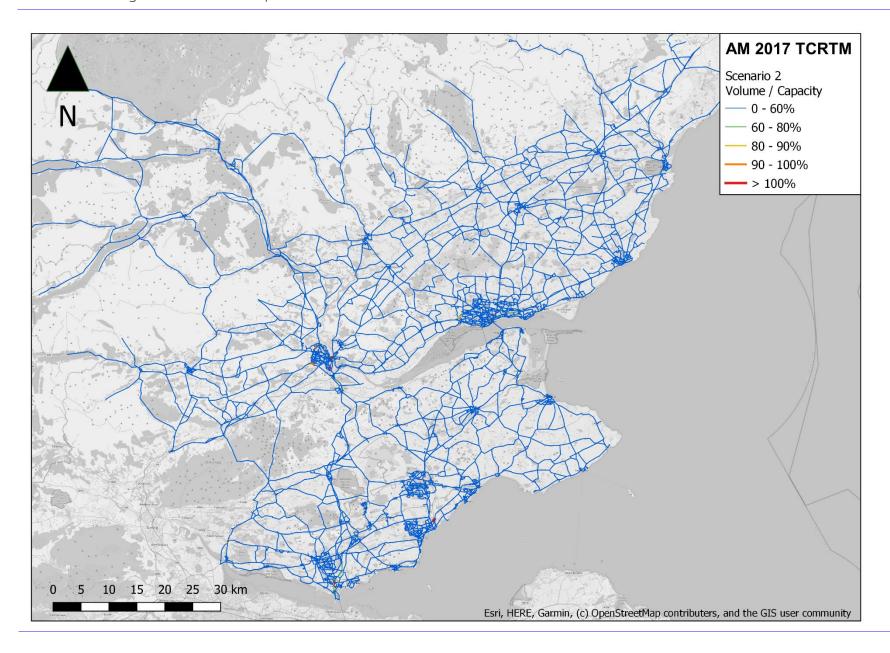

In scenario 2, a more balanced package is implemented, with the traffic reduction achieved by a combination of investment in public transport and active travel, encouragements to drive less, local traffic restraint measures (through stricter parking controls), and with the remaining traffic reduction requirement achieved through road user charging.

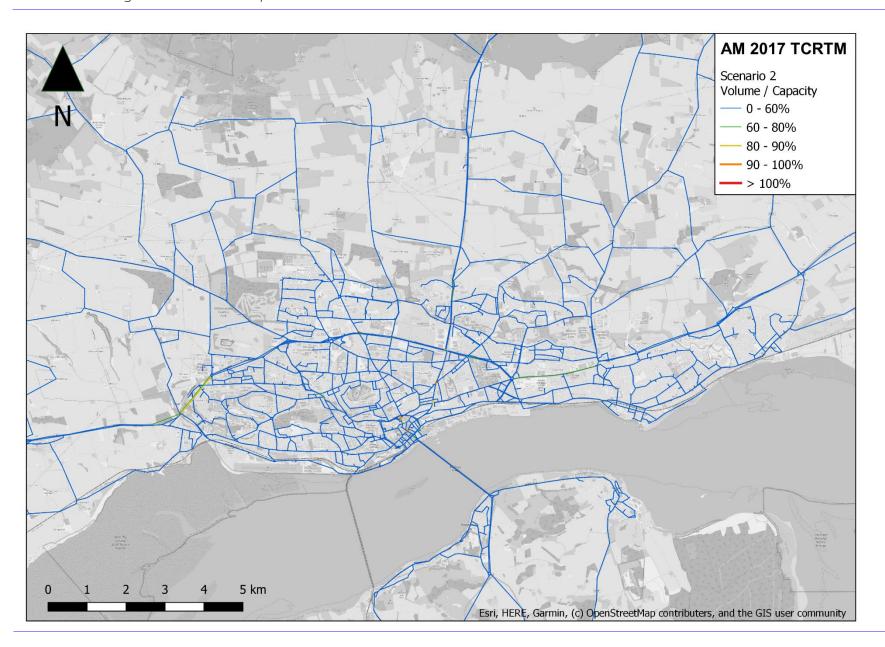

Scenario 1 tends to have a greater impact on longer-distance trips, whilst scenario 2 has a greater impact on (a larger number of) shorter trips.

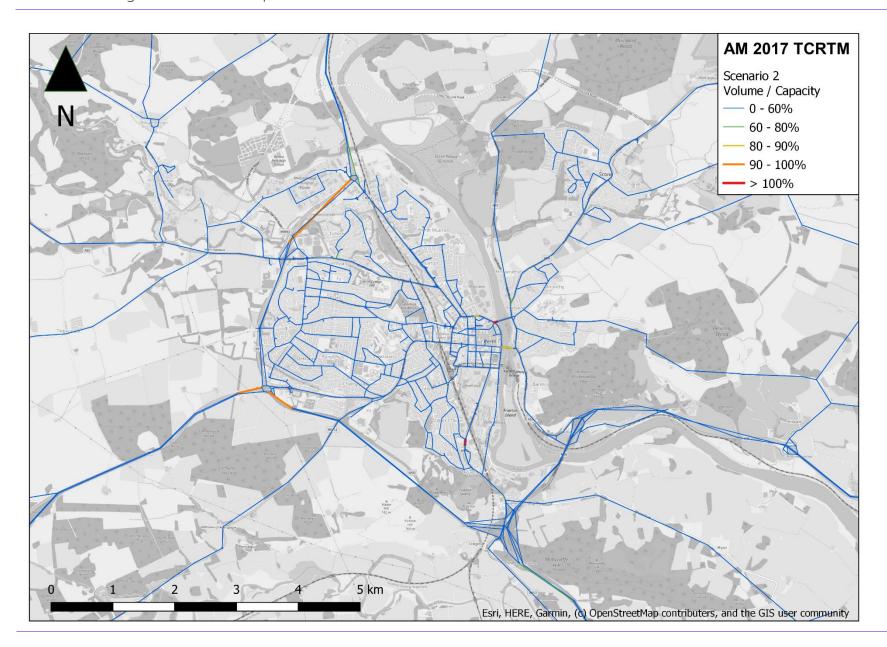

- vii The RTS states that "The ability to access services is influenced by a number of factors including availability and awareness of services; cost; difficulties in planning and undertaking multi-stage / multi-modal journeys etc. There are limited data sources to track ability of the target groups to access jobs, education and services. Whilst the following target is used to support this subject, it is acknowledged that a wider set of indicators that drive progress are required."
- viii To monitor this outcome, a survey repeating the SHS question '% of employed adults who could use public transport for work' would need to be undertaken in the regions' least affluent areas

<sup>&</sup>lt;sup>i</sup> Available at <a href="https://tactran.gov.uk/projects/regional-transport-strategy/">https://tactran.gov.uk/projects/regional-transport-strategy/</a>

Research commissioned by the Scottish Government suggests Scottish Government's Climate Change Action Plan identifies changing technology as achieving 72.7% of 2030 target and behaviour change as 27.3% of target (Element Energy 'Decarbonising the Scottish transport sector' 2021)

iii Scotland's Road Safety Framework to 2030 indicators

iv Transport Scotland's Second Strategic Transport Projects Review (STPR2)

<sup>&</sup>lt;sup>v</sup> To reduce inequalities, the goal would be to increase the levels of walking and cycling in the least affluent SIMD data zones to the same level as that in the most affluent areas. However, it is difficult to pick out differences at a local level, not least as most of the less affluent communities are in urban areas where active travel is higher than the average. It is possible however to seek to achieve the target levels of walking and cycling in the least affluent areas first (i.e. by 203), the STPR2 forecasts are to 2033.
